Table of Contents

| | |
|---|----|
| 'Cefalu' arrowleaf clover (<i>Trifolium vesiculosum</i> L.) | 1 |
| 'Bolta' balansa clover (<i>Trifolium michelianum</i> Savi) | 5 |
| 'Prima' gland clover (<i>Trifolium glanduliferum</i> Boiss.) | 9 |
| 'Mihi' Persian clover (<i>Trifolium resupinatum</i> L.) | 12 |
| Reference..... | 15 |
| Acknowledgements | 15 |

‘Cefalu’ arrowleaf clover **(*Trifolium vesiculosum* L.)**

A visual scale (numeric) of the reproductive development of an arrowleaf clover inflorescence

| Numeric description of reproductive stage | Illustration |
|---|--------------|
|---|--------------|

- 1 The inflorescence bud is visible in the axil of a leaf.

- 2 The peduncle is visible, the calyx is green (G or GY) and no corolla are visible.

3 At least one corolla is visible.

4 >80% of florets within the inflorescence have a visible corolla.

5 Full flower – 100% of corolla have the standard unfolded from the wings.

- 6** <50% of the inflorescence turned brown as an indication of pollination¹.
- 7** >50% of the inflorescence is brown. Pods are formed within the inflorescence starting from the basal inflorescence.
- 8** >50% of pods are formed in the inflorescence.

¹Petals that are brown/wilted with age are not counted.

- 9** >90% of the inflorescence is brown. >50% of pods are formed.

Pod filling

- 10** Seeds in the bottom pod turned yellow.
- 11** Seeds in the bottom pod turned red/brown. 50% of seeds turned yellow.
- 12** 50% of seeds turned red/brown.
- 13** 100% of seeds turned red/brown (5 YR 5/10, 2.5 YR 3/8, 10 R 3/2).

Note: seeds mature from the bottom to top of the pod & this image shows the progression of maturity for demonstrative purposes (i.e. not all seeds shown were out of the same pod).

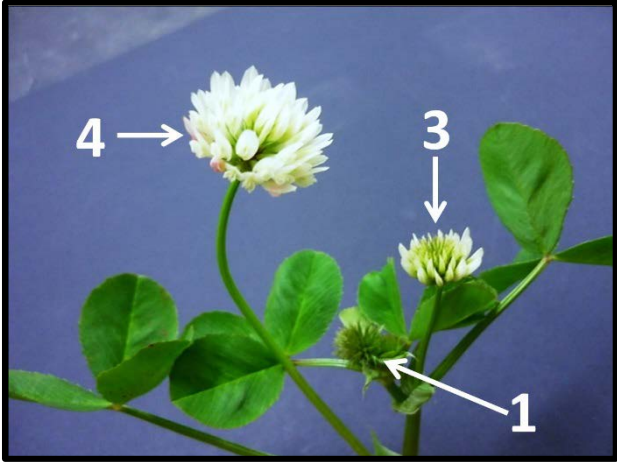

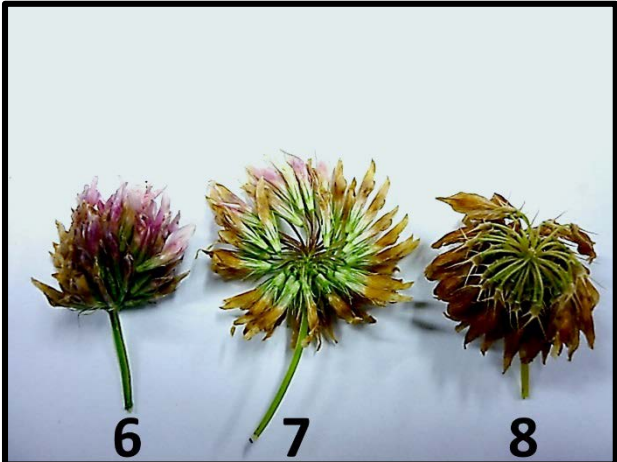

Seed development

Note: Values within parentheses correspond to Munsell (1977) colour charts for plant tissues. Colours are specified sequentially by Hue, Value and Chroma. For example 5YR 5/10 is an intermediate **Hue** between Yellow (Y) and Red (R) defined as 5YR. The **Value** (5/) relates to the "lightness" along a vertical scale from 0 (pure black) to 10 (pure white). The **Chroma** (10) relates to saturation along a horizontal plane. See also https://en.wikipedia.org/wiki/Munsell_color_system

‘Bolta’ balansa clover
(*Trifolium michelianum* Savi)

A visual scale (numeric) of the reproductive development of a balansa clover inflorescence

| Numeric description of reproductive stage | Illustration |
|---|--|
| <ol style="list-style-type: none"> 1 The inflorescence bud is visible in the axil of a leaf. 2 The peduncle is visible, the calyx is green (G or GY) and no corolla are visible (not shown). 3 At least one corolla is visible. 4 >80% of florets within the inflorescence have a visible corolla. |  |
| <ol style="list-style-type: none"> 5 Full flower – 100% of corolla have the standard unfolded from the wings. |  |
| <ol style="list-style-type: none"> 6 All florets within the inflorescence show browning as an indication of pollination¹. 7 Abscission layer formed and florets have drooped downwards. 8 Pods are visible within inflorescence. |  |

¹Petals that are brown/wilted with age are not counted.

9 >50% of outer pedicels¹ show red (R) colouring.

10 50% of pods are red.

11 100% of pods are red.

Stage 10

12 50% of pods are yellow (2.5Y (8/8 to 10) or 5Y (8/8 to 10).

Stage 12

13 100% of pods are yellow.

Stage 13

¹ A pedicel is the stem which attaches an individual flower to an inflorescence

14 First sign of seeds darkening (7.5YR (6/8) to 5 YR (2/3)).

15 100% of seeds are dark (7.5 YR (6/8) to 5 YR (2/3)).

16 Seed shatter upon burst pods.

Pod development.

Note: Values within parentheses correspond to Munsell (1977) colour charts for plant tissues.

‘Prima’ gland clover
(*Trifolium glanduliferum* Boiss.)

A visual scale (numeric) of the reproductive development of a gland clover inflorescence

Numeric description of reproductive stage

Illustration

- 1 The inflorescence bud is visible in the axil of a leaf.
- 2 The peduncle is visible, the calyx is green (G or GY) and no corolla are visible.
- 3 At least one corolla is visible.
- 4 >80% of florets within the inflorescence have a visible corolla.

- 5 Full flower – 100% of corolla have the standard unfolded from the wings.

- 6 Florets on the base inflorescence turned purple as an indication of pollination¹.

¹Petals that are purple/wilted with age are not counted

-
- 7** Florets on the top inflorescence turned purple. Abscission layer formed starting from the base inflorescence

-
- 8** Pods are visible within the inflorescence.
- 9** Pods enlarge, green (G or GY) in colour.
- 10** Formation of one or more complete seeds. Seeds are green in colour (5 GY (5/10 to 6/8)).
- 11** Pods are green yellow (2.5 GY (8/4 to 8/6)). First sign of seed yellowing (5 Y (8/4 to 2.5 GY 8/10)).
- 12** Seeds are hard and 100% of seeds are yellow (2.5 Y 8/6 to 5 Y 8/8).
- 13** Seeds shatter upon rubbing.

Seed development

Note: Values within parentheses correspond to Munsell (1977) colour charts for plant tissues.

‘Mihi’ Persian clover **(*Trifolium resupinatum* L.)**

Visual scale (numeric) of the reproductive development of a Persian clover inflorescence

Numeric description of reproductive stage

Illustration

- 1 The inflorescence bud is visible in the axil of a leaf.
- 2 The peduncle is visible, the calyx is green (G or GY) and no corolla are visible.

- 3 At least one corolla is visible.
- 4 >80% of florets within the inflorescence have a visible corolla.

- 5 Full flower – 100% of corolla have the standard unfolded from the wings.
- 6 Florets turned brown as an indicator of pollination starting from the basal inflorescence¹.

¹Petals that are brown/wilted with age are not counted

7 All florets within the inflorescence turned brown.

8 Inflorescence swell, pods start to form within the inflorescence.

9 Pods enlarge, green in colour.

10 Pods turned yellow. Seeds are green in colour.

11 Pods turned brown. First sign of seeds change colour.

12 Pods burst.

Note: Values within parentheses correspond to Munsell (1977) colour charts for plant tissues.
